

Enhanced Ethernet Switching Technology for Adaptive Hard Real- Time Applications

Rui Santos
(rsantos@ua.pt)

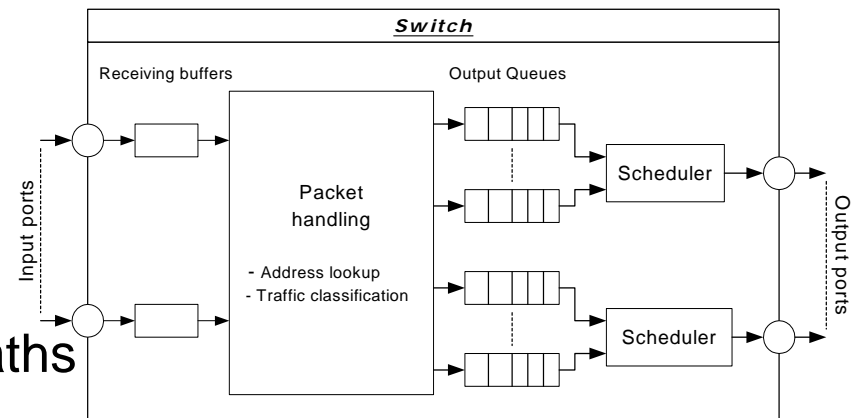

7 / 05 / 2009

Problem

■ Switched Ethernet became common in real-time communications

□ Some interesting properties

- Large bandwidth
- Cheap network controllers
- Micro-segmentation
 - Collisions are eliminated
- Multiple parallel forwarding paths
- High availability

■ But there are still limitations

- FIFO queues
- Limited number of priorities
- Memory overflows

Solutions

■ **Commercial Off-The-Shelf Ethernet switches**

- Limiting the generated traffic by the application design
- Traffic shaping
- Master-Slave protocols (FTT-SE, ...)

■ **Customized Ethernet Switches**

- TTEthernet
- Profinet-IRT
- FTT-Enabled Switch (HaRTES) - our solution

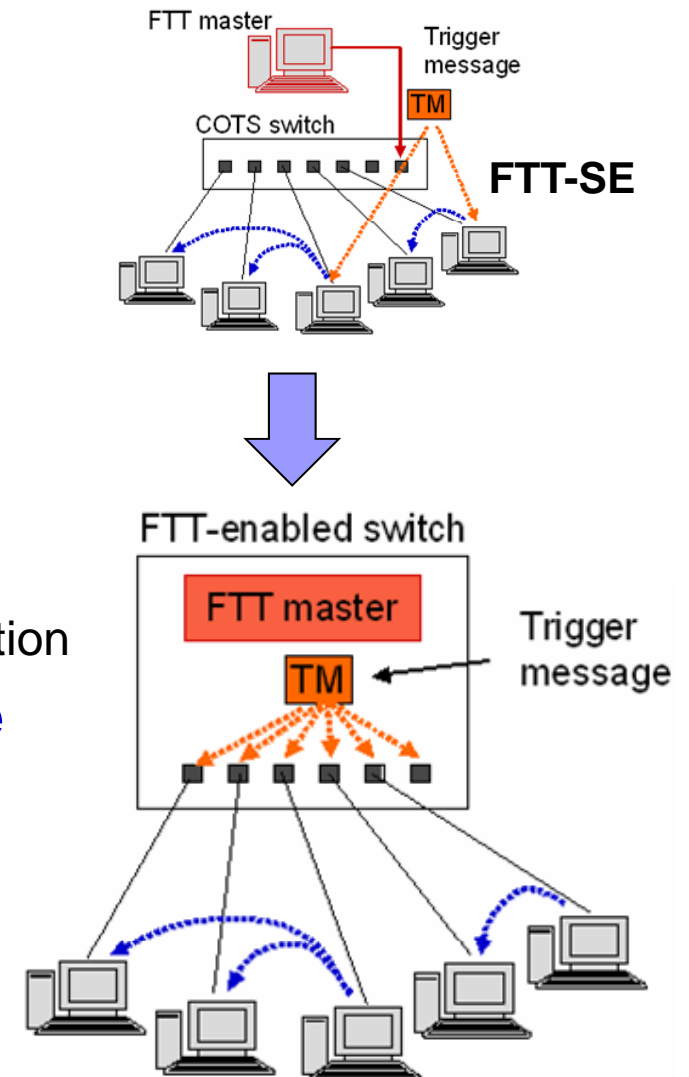

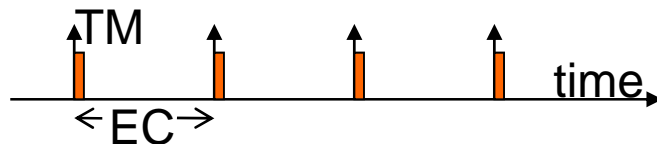

TTEthernet & Profinet-IP **Limitations**

- Require a **static pre-defined configuration** for the real-time traffic
- **On-line admission control** is **not** generally available
- **Miss on-line adaptation** to the communication requirements and quality-of-service policies

FTT-E. Switch (HaRTES) Protocol Mechanism

- Based on **Flexible Time-Triggered Paradigm**
- **Master-slave** transmission control technique
- Communication occurs in fixed slots (**Elementary Cycles – ECs**)
 - ECs are organized in **RT** and **NRT** windows
 - Supports **synchronous**, **asynchronous** and **non real-time** traffic, with strict temporal isolation
- The **ECs** start with a **Trigger Message (TM)** sent by the Master (switch)
 - **TM** contains the **schedule** for each **EC**

FTT-E. Switch (HaRTES) Properties

■ Traffic scheduling and management

Old □ Global traffic coordination in a common timeline

- Master synchronizes all nodes

Old □ Supports online admission control and dynamic QoS management

Old □ Allows arbitrary traffic scheduling policies

New □ Reduction in the switching latency jitter

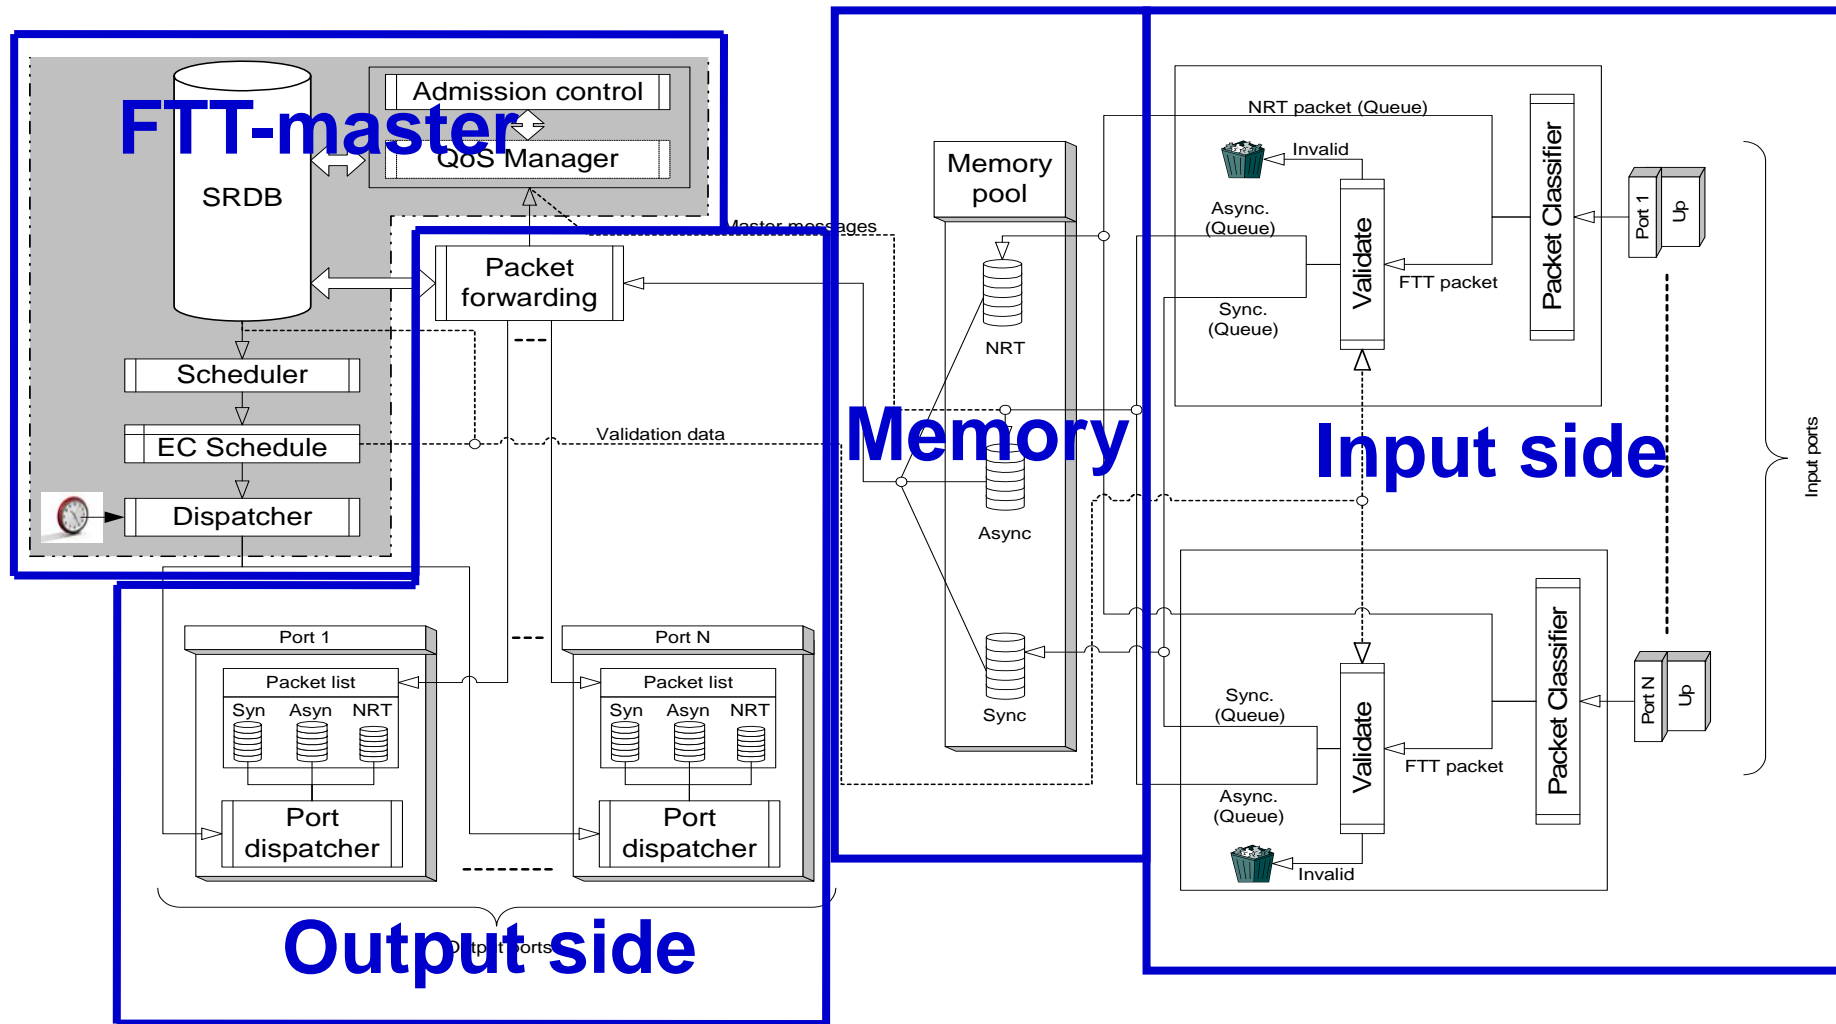

■ Traffic classification, confinement and policing

New □ Seamless integration of standard non-FTT-compliant nodes without jeopardizing the real-time services

New □ Asynchronous traffic is autonomously triggered by the nodes

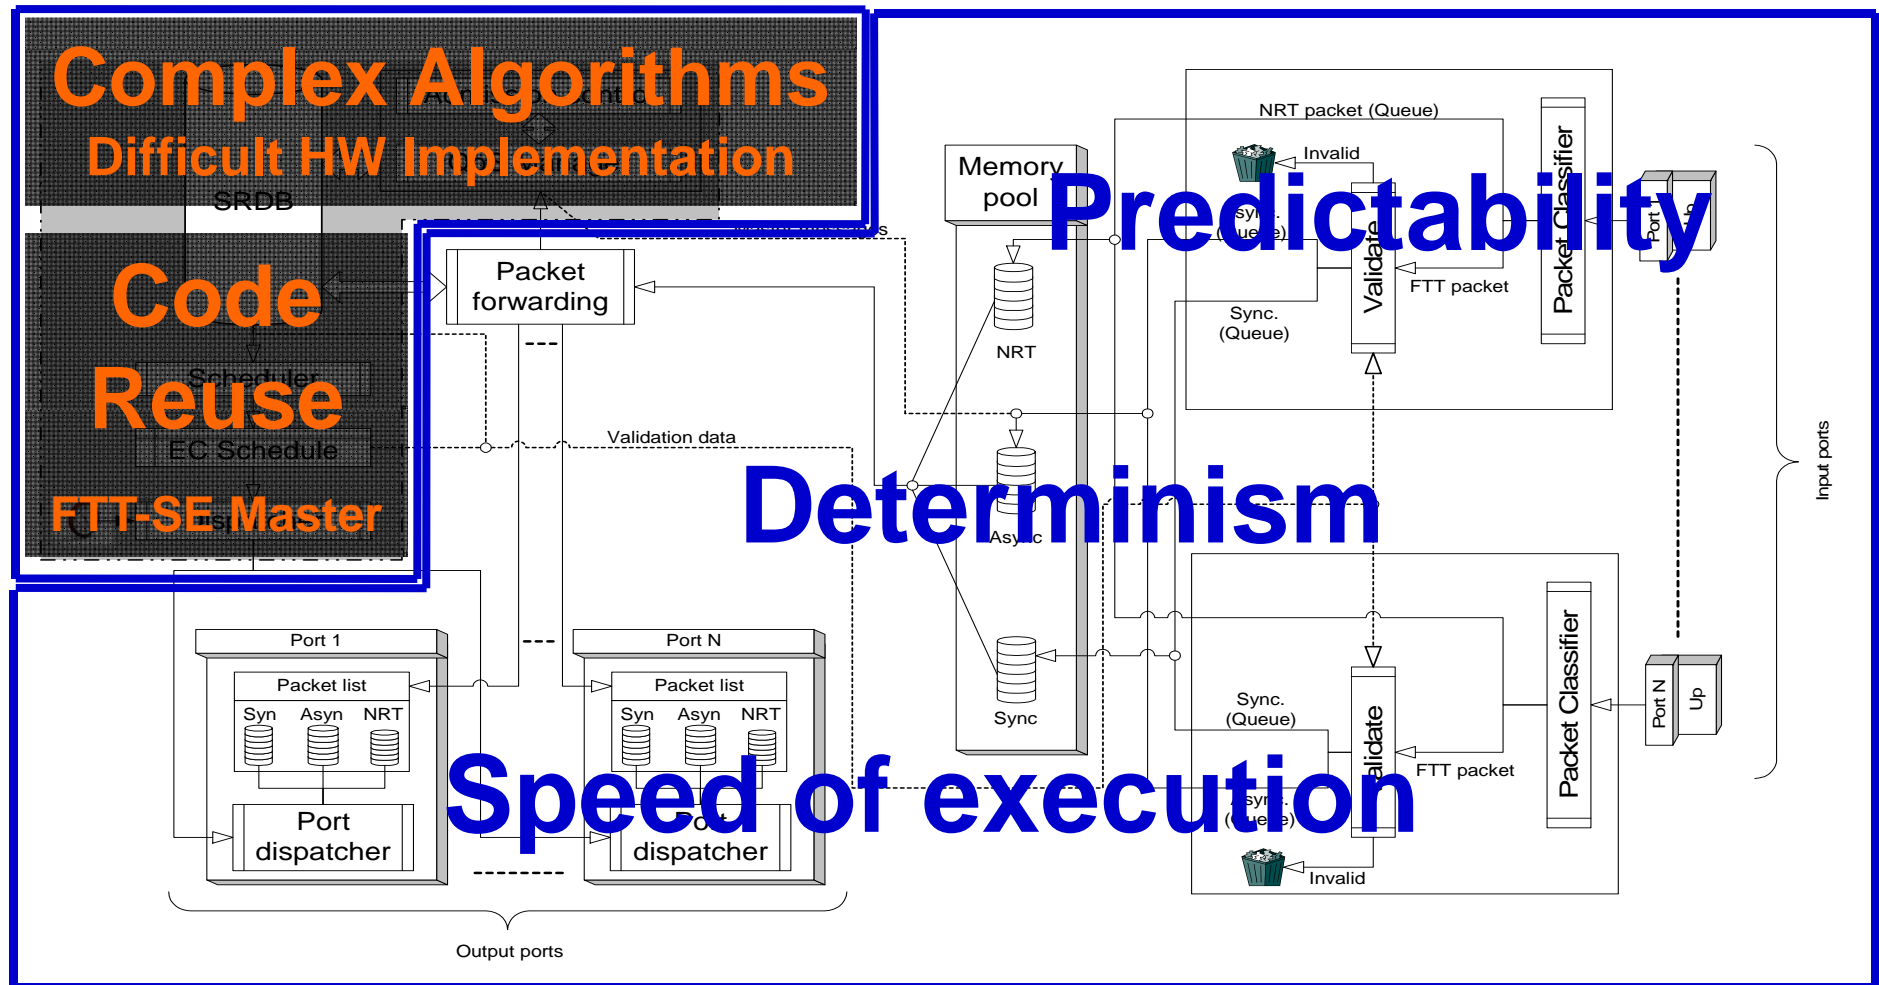

New □ Non-conforming transmissions can be readily identified and blocked at the switch input ports, thus not interfering with the rest of the system

FTT-E. Switch (HaRTES) Architecture

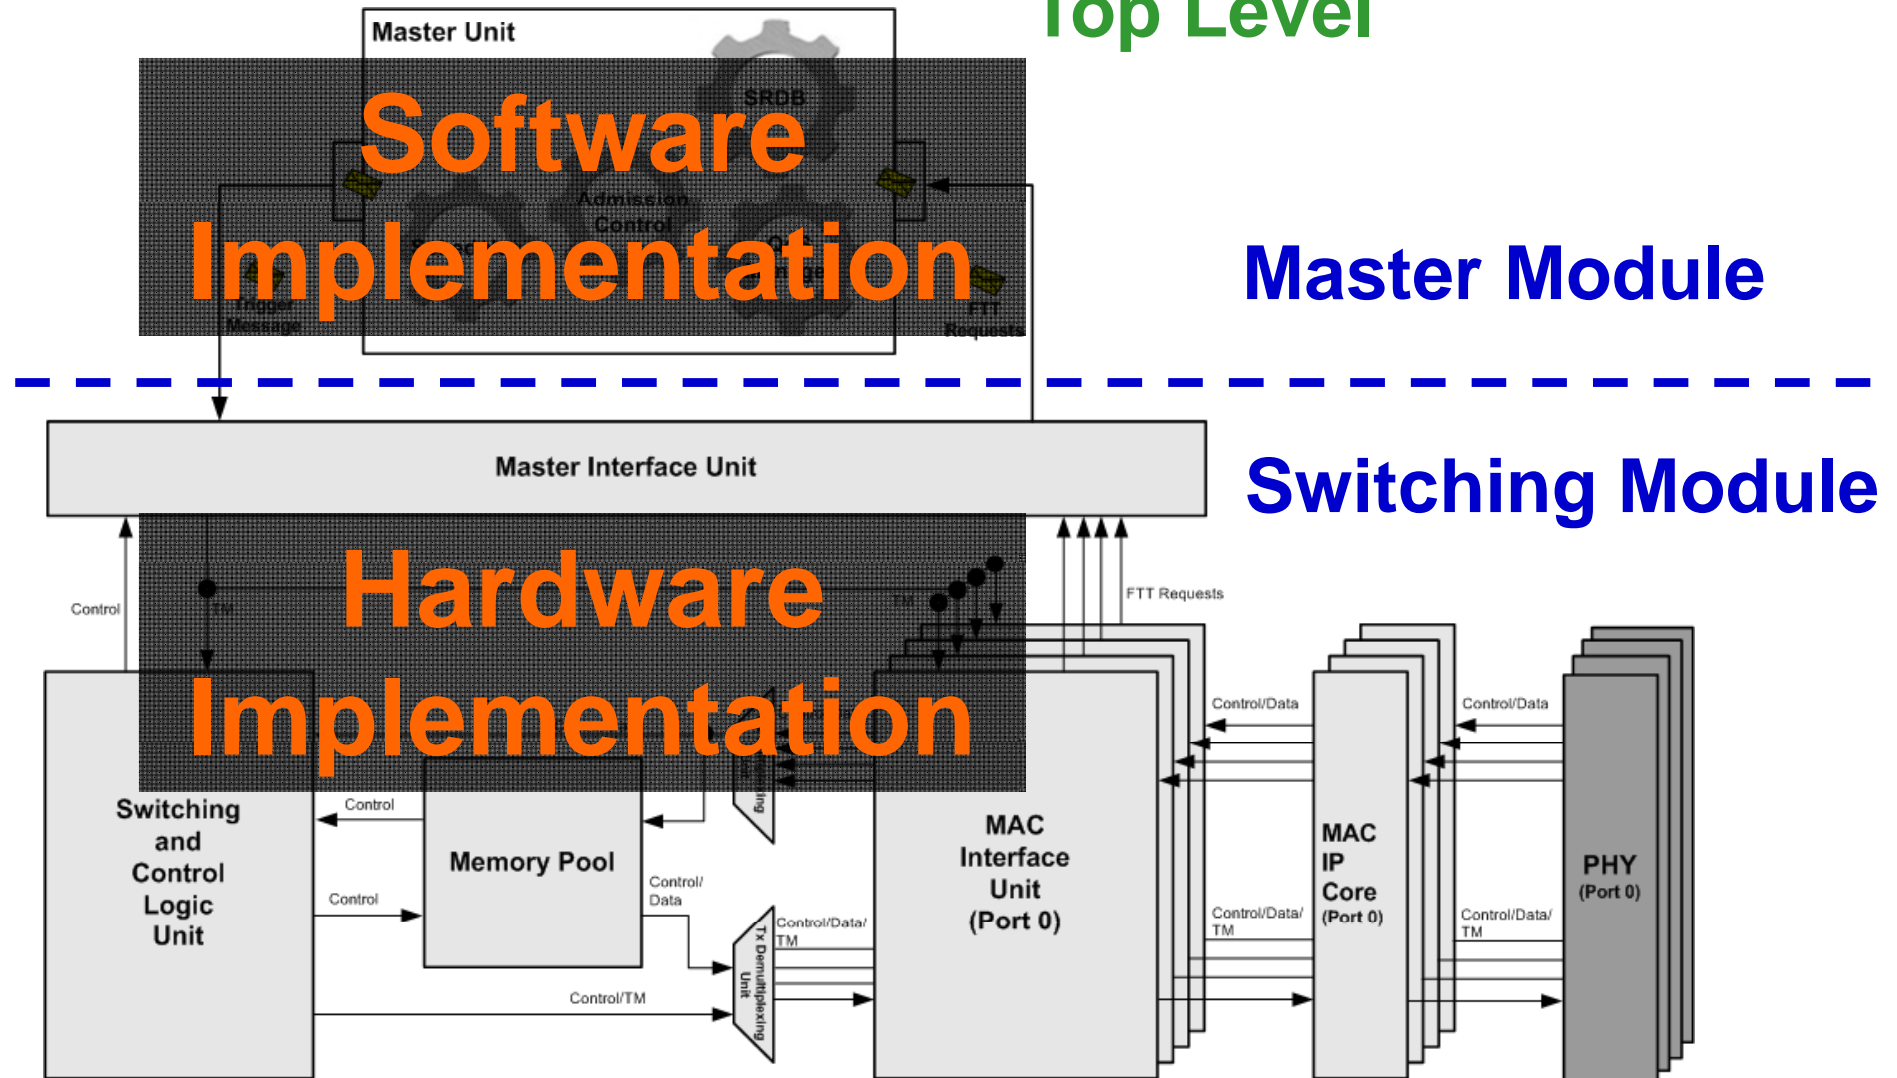

FTT-E. Switch (HaRTES) Architecture

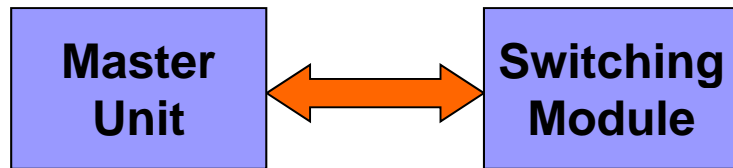

FTT-E. Switch (HaPTES)

Implementation Top Level

FTT-E. Switch (HaPTES) **Implementation**

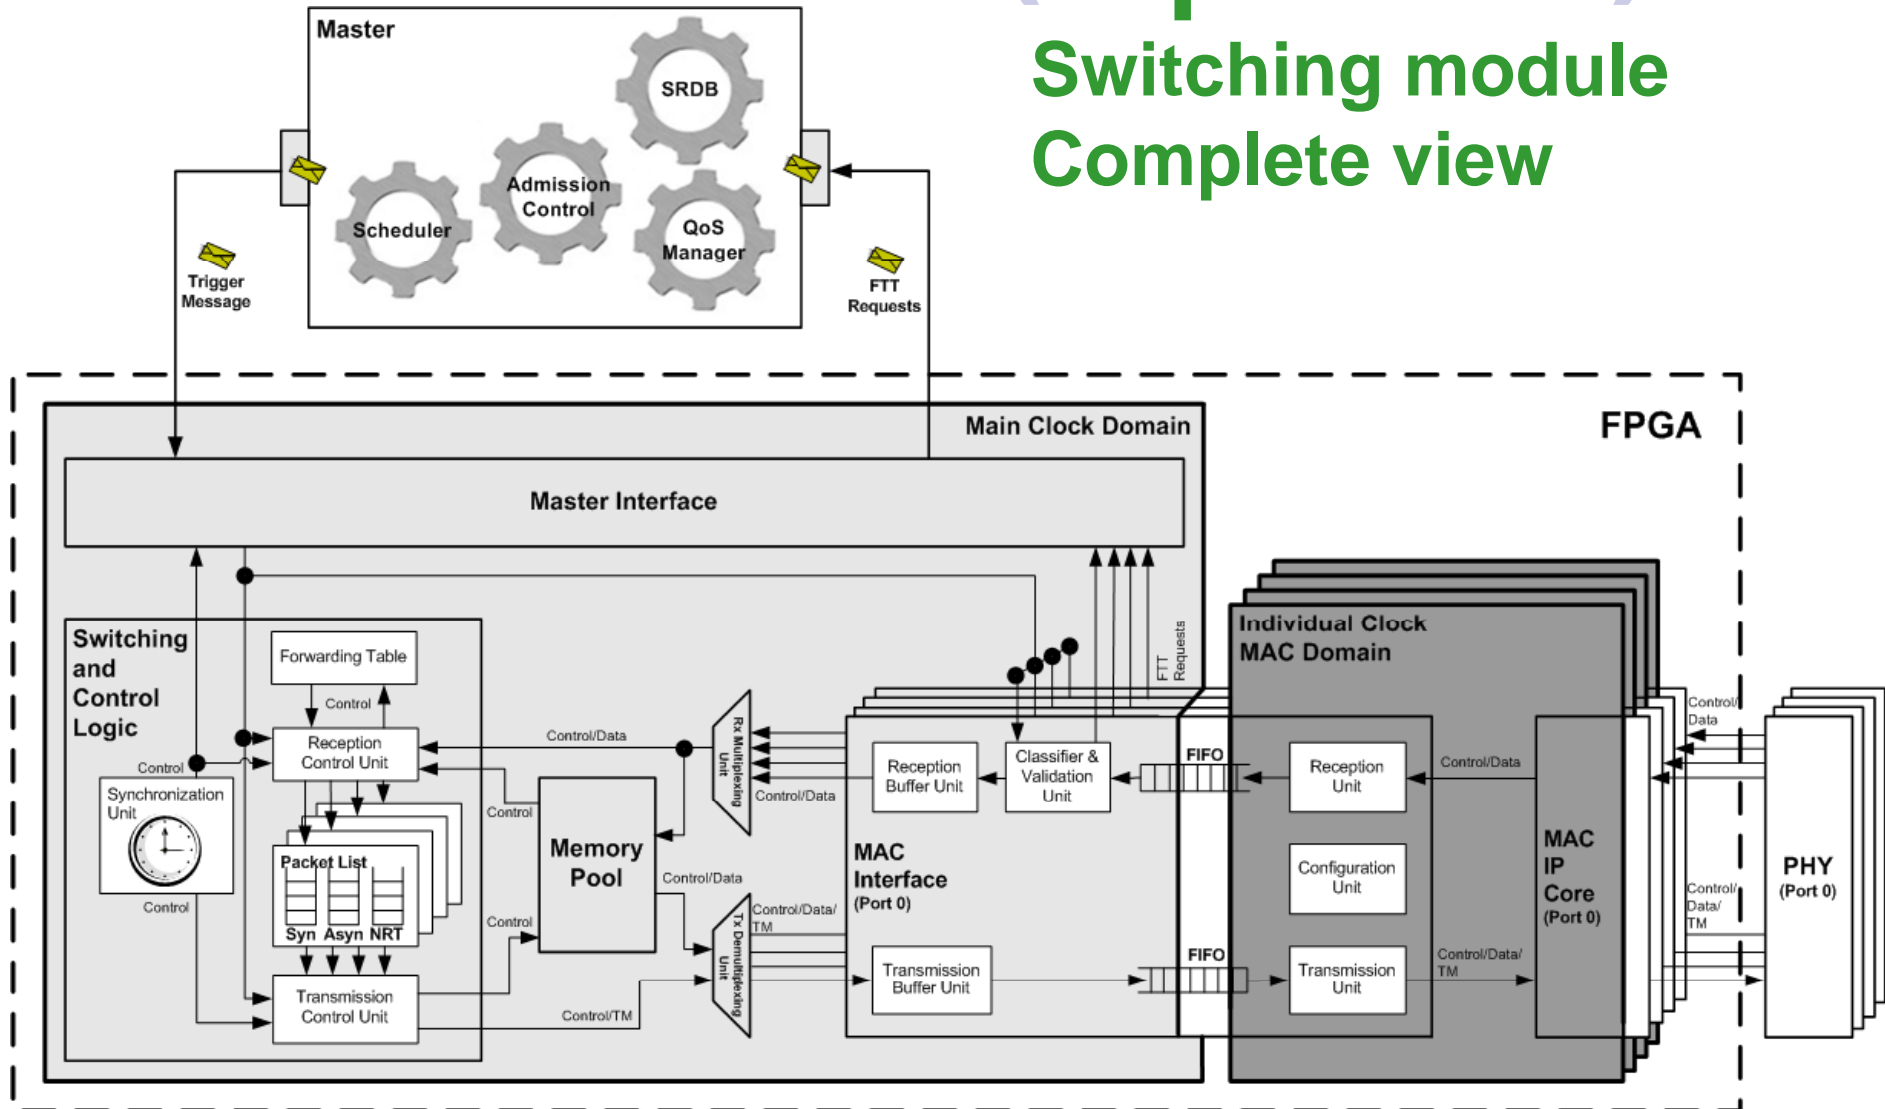

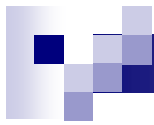

Master Unit & Switching module integration

- **Utilization of an FPGA embedded processor (Synthetizable or Hardwired)**
 - ☐ More FPGA resources required
- **Independent CPU – communication with the FPGA is carried out by conventional interface (Ethernet, USB PCI, ...)**
 - ☐ More expensive
 - ☐ More free space in the FPGA
 - ☐ Sharing the FTT-Master between FTT-SE version and FTT-Enabled Switch

FTT-E. Switch (HaPTES)

Implementation Switching module Complete view

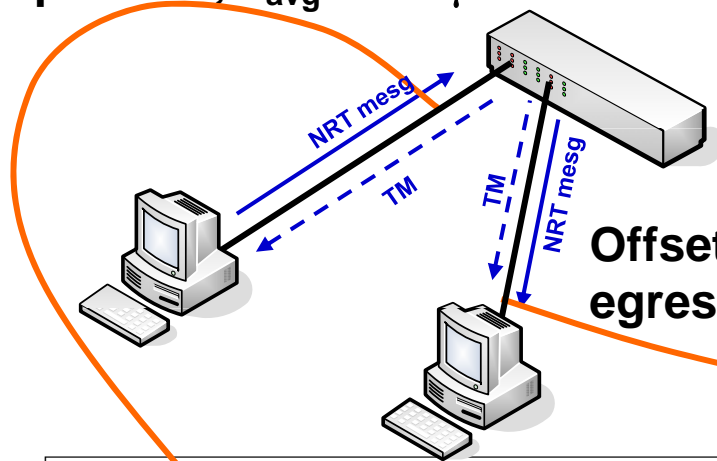

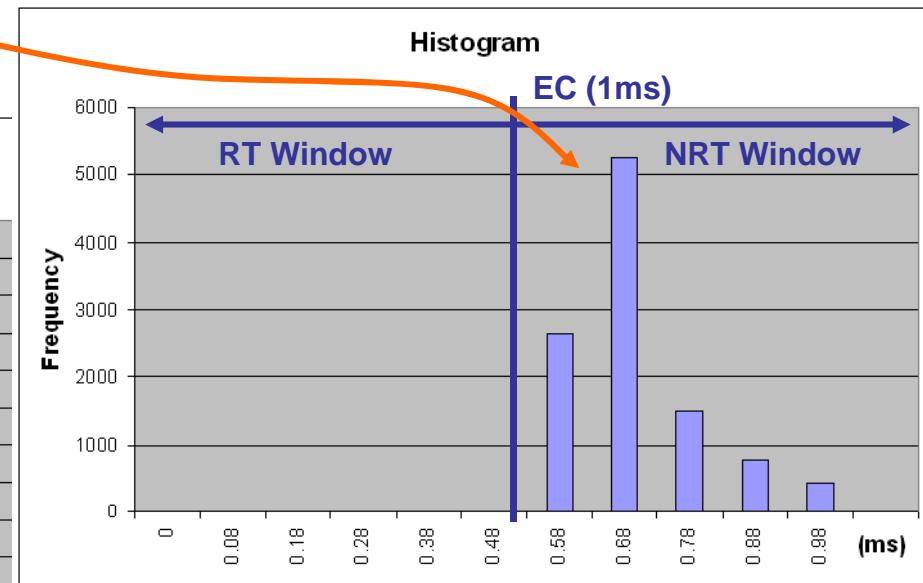

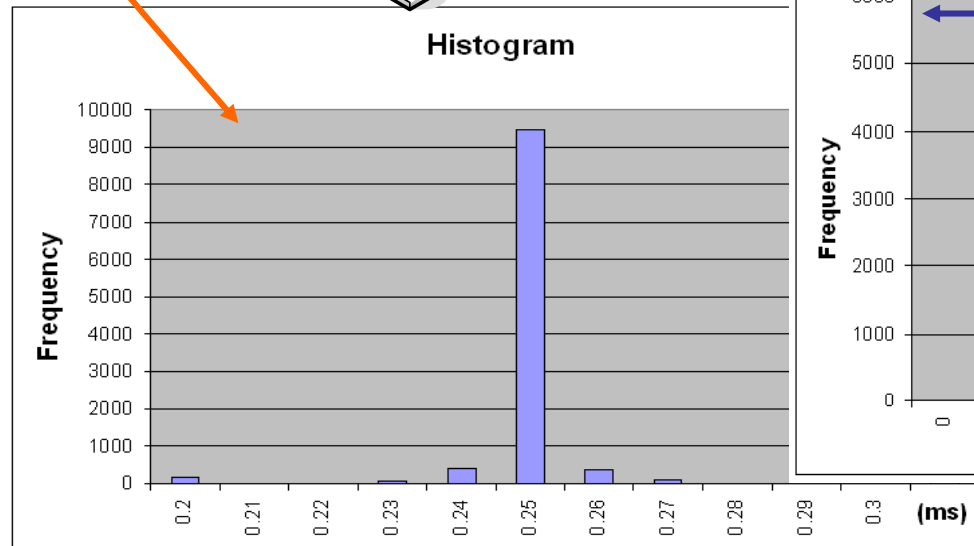

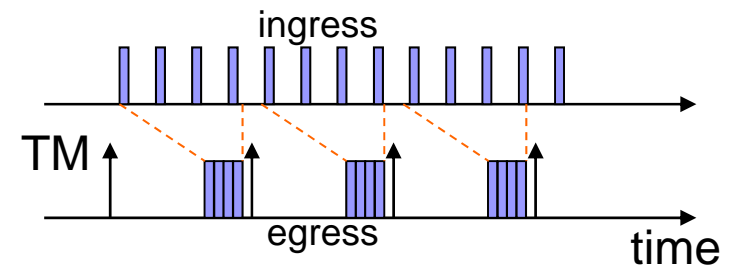

FTT-E. Switch (HaRTES)

Experimental Results Confinement of NRT Traffic

Submitted traffic
1kB packets, $T_{avg} = 250\mu s$

Offset at the switch
egress (relative to the TM)

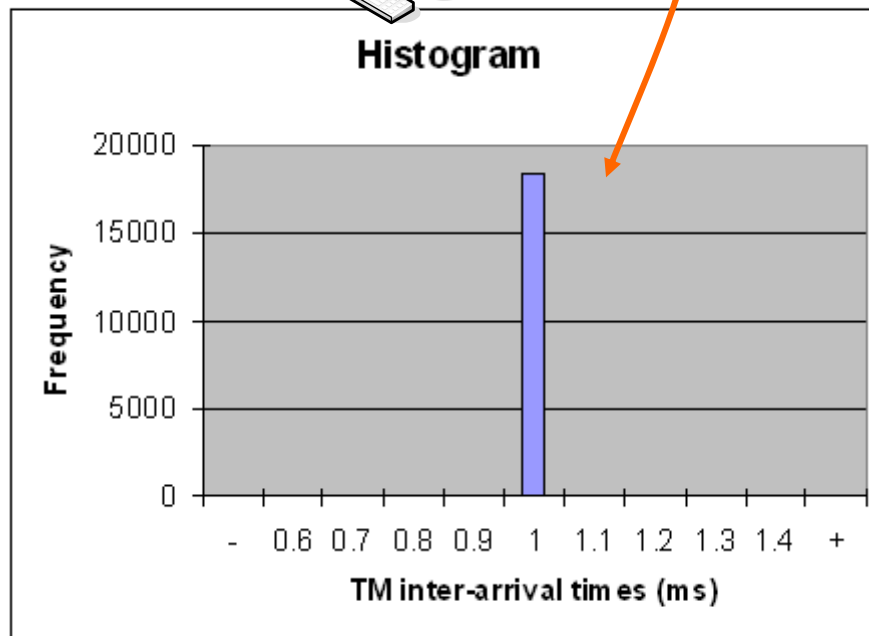

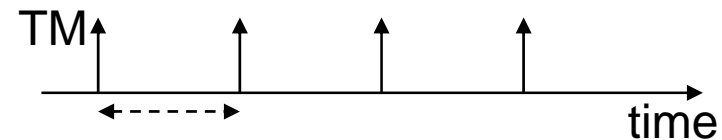

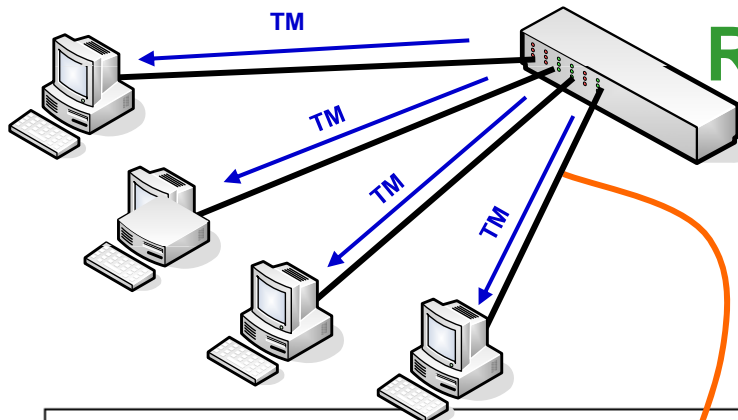

FTT-E. Switch (HaRTES)

Experimental Results

Regularity of the TM

■ Measures:

- $T_TM_{avg} = 1,000ms$
- $T_TM_{max} = 1,0003ms$
- $T_TM_{min} = 0,99998ms$
- $STD_TM = 138ns$

Jitter purely from the switch

FTT-E. Switch (HaRTES)

Current Status

■ HaRTES/B

- ☐ Basic switching
- ☐ Capability to separate different traffic classes
- ☐ On-line scheduling

Executed

Partially executed

Not yet executed

■ HaRTES/S

- ☐ Error detection
- ☐ Traffic policing

Partially executed

■ HaRTES/Q

- ☐ Dynamic QoS management capabilities

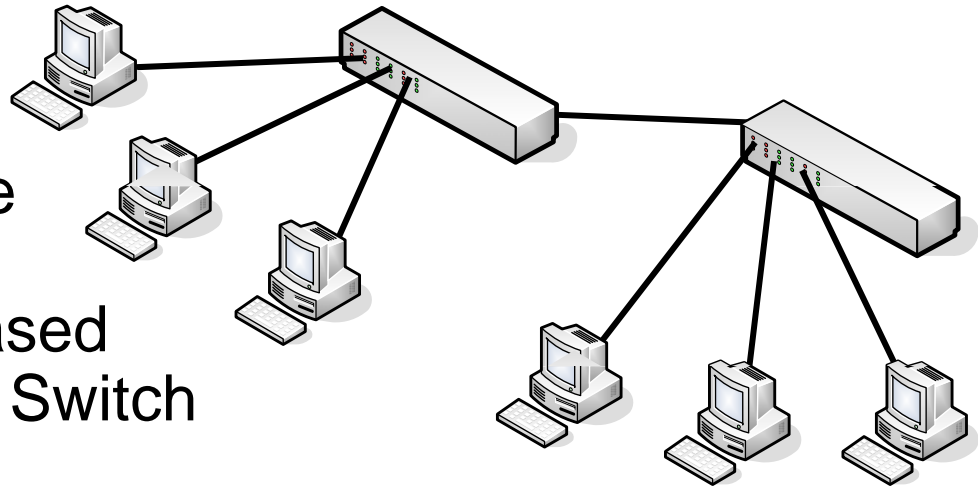

Not yet executed

FTT-E. Switch (HaRTES)

Multiple Switches

■ Problem

- How to create a network with multiple switches, where the communication is based on the FTT-Enabled Switch (HaRTES)?

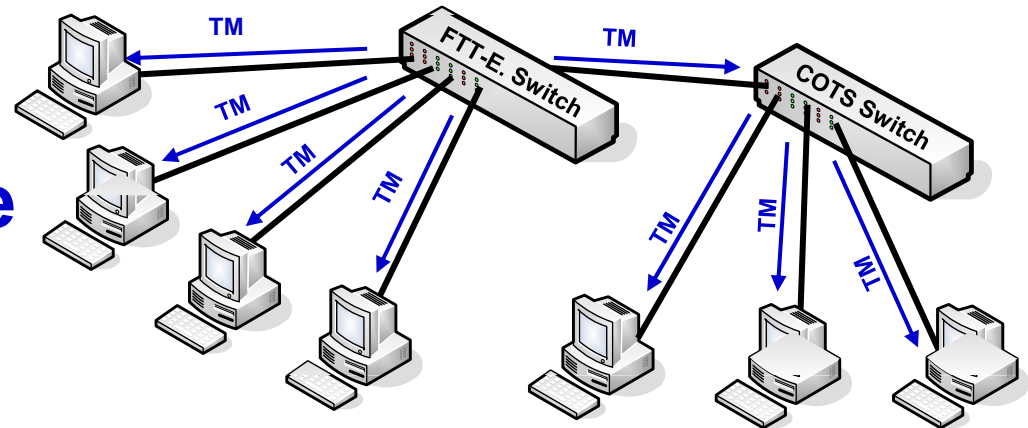

■ Solutions

- Network with one FTT-Enabled Switch and multiple COTS switches
- Network with multiple FTT-Enabled Switches

FTT-E. Switch (HaRTES)

Multiple Switches

- **Network with one FTT-Enabled Switch and multiple COTS switches**

- **Properties**

- Trigger Messages are generated by FTT-Enabled Switch and disseminated by the others switches

- **Advantages and Disadvantages**

- ✓ ■ Solution compatible with common networks
 - ✓ ■ COTS switches are cheaper
 - ✗ ■ COTS switches don't perform traffic policing
 - ✗ ■ The Trigger Message latency can generate problems of synchronization

FTT-E. Switch (HaRTES)

Multiple Switches

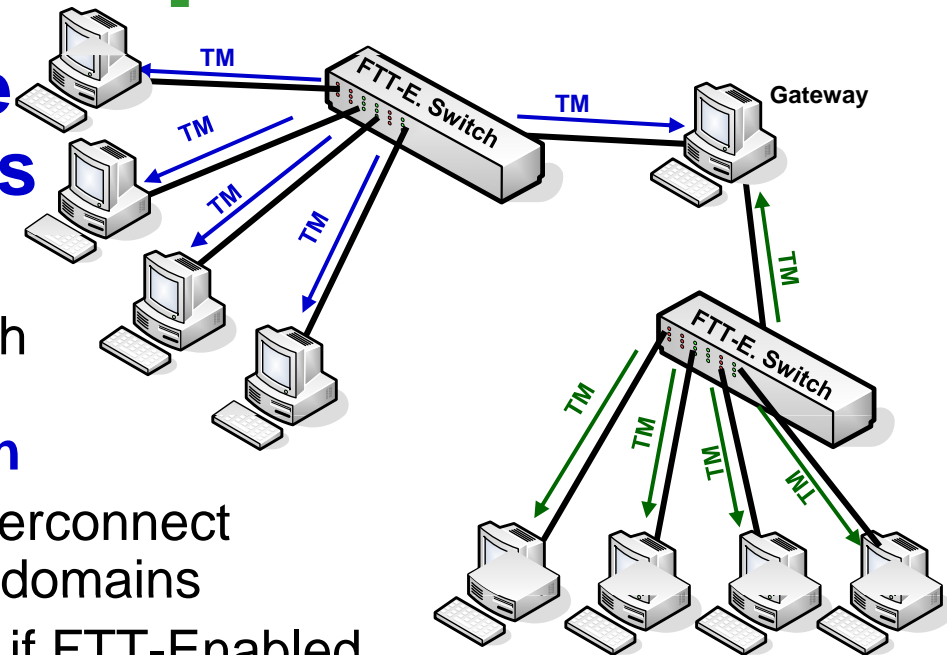

■ Network with multiple FTT-Enabled Switches

□ Properties

- Each FTT-Enabled Switch creates its own **synchronization domain**
- It needs a **gateway** to interconnect different synchronization domains
- Gateway can be avoided if FTT-Enabled Switches are slaves to each other

□ Advantages and Disadvantages

- ✓ ■ Whole network is covered by the traffic policing
- ❌ ■ It needs a gateway
- ❌ ■ More expensive

Server / FTT-E Switch

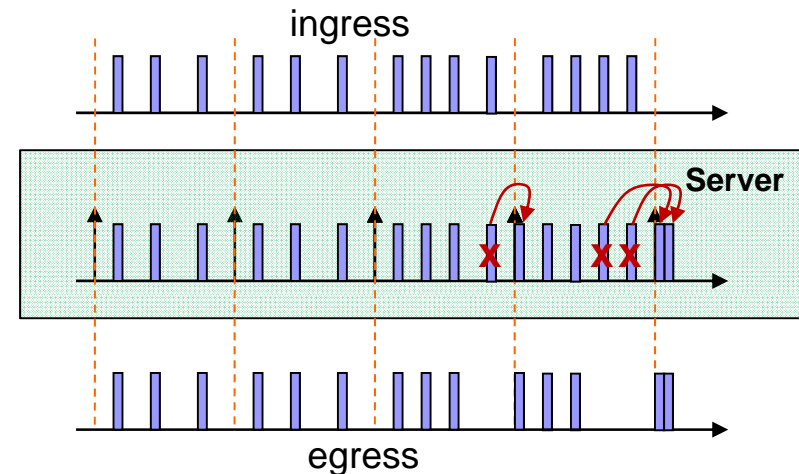

Another protocol

■ Motivation

- Synchronous (TT) Real-Time Ethernet protocols have difficulties in efficient handling messages streams that are asynchronous
 - Video streams, Alarms, Sensors, ...

■ Solution

- We propose to integrate CPU based server policy in the FTT-Enabled Switch
 - Polling Server, Deferrable Server, Sporadic Server, ...
- Providing **reconfigurability** and **adaptability**
 - Online creation, deletion and adaptation of servers

■ Advantages

- ✓ □ Full control over streams of messages, no matter the arrival patterns
- ✓ □ Unnecessary to send trigger message to the slaves.

Conclusions

- The growing availability of FPGAs, associated tools and communication IP cores opens the way to build customizable devices with properties that are tuned to specific application domains
- We propose an enhanced Ethernet switch that brings substantial improvements in timeliness, integrity and operational flexibility:
 - Isolation of traffic classes
 - Integration of standard Ethernet nodes
 - Transmission of the Trigger Message with high precision
- The proposed hardware/software partition allows reusing the FFT-SE Master with minimal adaptations

Future Work

- Finish the propose work on the project
- Integrate multiple switches
- Adapt the enhanced switch to allow integration in architectures with multiple synchronization domains
- Replicate the Master
- Integrate CPU based server policy
